By

RECEIVED

DEC 30 2005

ENGINEERING DIVISION

Boschee Engineering

December, 2005

FOR REVIEW ONLY

INTRODUCTION

GENERAL

This Amendment to the Red Rock Drainage Basin Design Plan has been prepared for the City of Rapid City by Boschee Engineering. The purpose of this amendment is to reevaluate the location of Detention Pond 101 based on current development within the Red Rock Drainage Basin.

All recommendations for the facilities evaluated made in this report supersede those given in the 1993 DBDP.

DESIGN PLAN LIMITATIONS

It was beyond the scope of work to provide final engineering drawings suitable for construction. Exceptions to this are Pond 101 and Pond 201 which were designed as part of this Amendment.

The design plan presented herein is conceptual and is intended to provide the general information necessary for the final working design of an efficient, planned system. The design plan is based on a practical hydraulic system which is suitable for further evaluation and implementation as the basin develops.

This AMENDMENT provides for only major drainage. Unless specifically addressed in the report, localized or minor drainage was beyond the scope of the study.

Note that the design plan runoff/routing analysis is considered an approximation since storms rarely follow ideal patterns and other factors such as ground cover, infiltration, and channel conditions may vary with time or from assumed conditions. The intent of a hydrologic runoff/routing analysis is to provide a reasonably dependable and consistent approximation of rainfall-runoff characteristics. It is also worth noting that the design analysis assumes unobstructed flow in pipes and channels.

HYDROLOGY AND HYDRAULICS

METHODOLOGY

The computer models used in the 1993 DBDP were used in the analysis and preparation of this AMENDMENT. Modeling input data was revised to account for the proposed changes discussed in this report.

COMPUTER MODEL REVISIONS

It was necessary to revise the 1993 DBDP sub-basin and flow network in order to model the proposed changes.

Figure 1 shows the updated sub-basin boundaries for the upper drainage basins in the Red Rock Drainage Basin. All land use conditions in this AMENDMENT are future land use conditions and assumed sub-basin imperviousness is included in the CUHP data. The 1993 DBDP also contains a map showing future assumed land use. These changes are described in the next section of this report

Figure 2 shows the updated flow routing network for the elements modified for this AMENDMENT. New elements 105 and 201 were added to the routing network. These changes are described in the next section of this report.

AMENDED DESIGN PLAN

GENERAL

The Amended Design Plan follows the conceptual plan recommended in the 1993 DBDP. The City of Rapid City directed that all metering dams be below the size regulated by the State of South Dakota as a Small Dam. It was also a requirement that flows downstream not be increased with this AMENDMENT. Major AMENDMENT changes thus made were the addition of Ponds 105, Pond 201 and relocating Pond 101. Note that all changes were made upstream of Element 2.

SUB-BASIN MODIFICATIONS

Sub-basin Z:

This sub-basin was added during the design of Detention Cell 102 to better reflect the flow patterns into the detention cell. Sub-basin Z was created by a reduction in the size of sub-basin J.

Sub-basin J:

Sub-basin J was also changed during the design of Detention Cell 102. This sub-basin was reduced in size to better reflect the flow patterns to Detention Cell 102. The reduction in sub-basin J was accounted for in sub-basin Z.

Sub-basin I:

Sub-basin I was reduced in size from 224 acres to 132.5 acres. This reduction was made to reflect the current development plans for this sub-basin.

Sub-Basin M:

Sub-basin M was increased in size to account for the acres lost in reduction of sub-basin I.

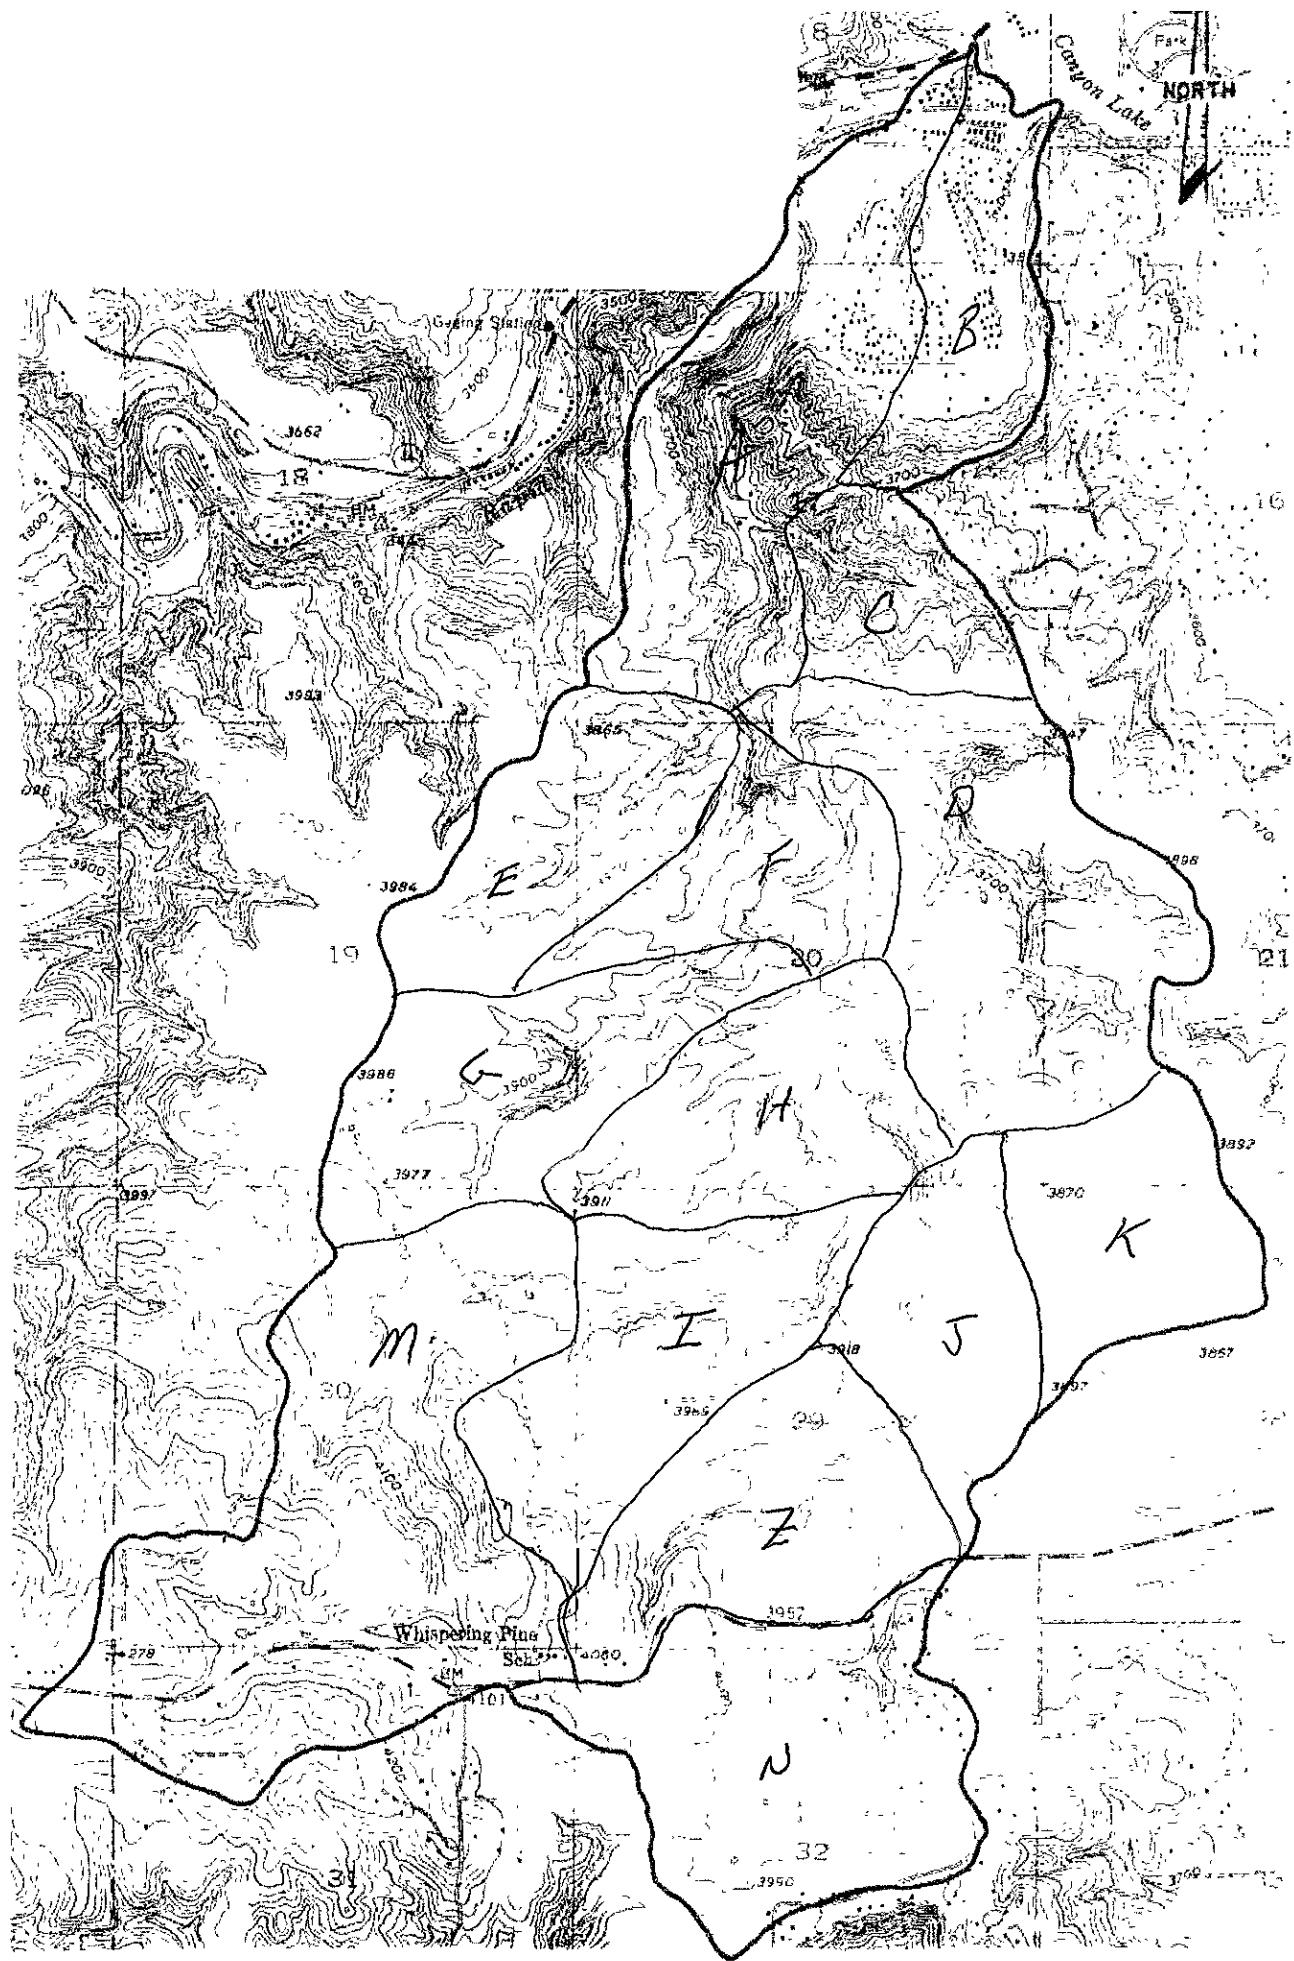

FIGURE 1: DRAINAGE BASINS MAP

Refer to Orginal Basin
Plan For Continuation

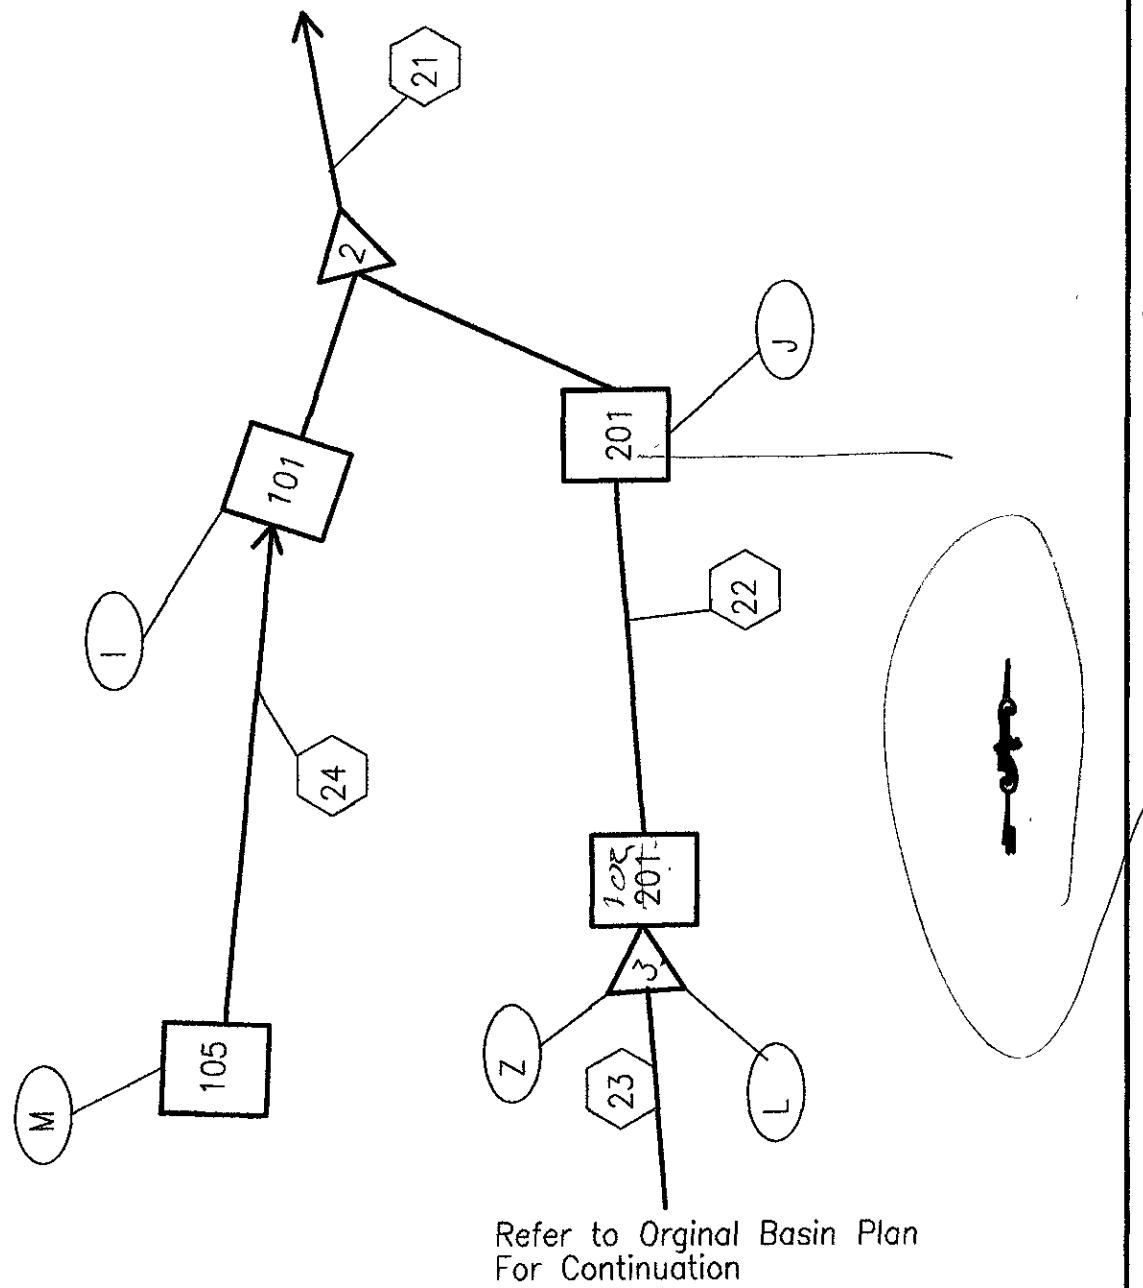

Figure 1: RED ROCK CANYON 2005 AMENDMENT HYDROLOGIC SCHEMATIC

N.T.S.

INDIVIDUAL ELEMENT DESIGN

A discussion of each of the revised routing elements in the Red Rock Basin follows.

Element 24:

Element 24 was shortened in length. Element 24 in this run is an existing open channel beginning at the outlet of Detention Cell 105 and ending at Detention Cell 101. For this AMENDMENT Element 24 has a length of 3150 feet and a slope of 2.2 percent

Detention Cell 105:

Detention Cell 105 is modeled as a dry detention cell that will be created by replacing the existing box stand pipe structure with a 48- inch stand pipe, with an 18 – inch orifice. Additional grading will need to be completed to provide 25 acre-feet of storage in the pool area.

The peak 10 year outflow from Detention Cell 105 will be 85 cfs and the peak 100-year outflow will be 215 cfs.

Detention Cell 201:

Detention Cell 201 is modeled as a dry detention cell with an 8' x 6' box stand pipe structure with a 60- inch outlet pipe, with a 24 – inch orifice. During the 100-year event an earthen spillway will be used to discharge part of the 100-year peak. Additional grading will need to be completed to provide 11 acre-feet of storage in the pool area.

The peak 10 year outflow from Detention Cell 201 will be 238 cfs and the peak 100-year outflow will be 514 cfs.

Detention Cell 101:

Detention Cell 101 is modeled as a dry detention cell with 60- inch outlet pipe. Additional grading will need to be completed to provide 6 acre-feet of storage in the pool area.

The peak 10 year outflow from Detention Cell 201 will be 119 cfs and the peak 100-year outflow will be 325 cfs.

Flow Summaries:

Tables 1 through 3 summarizes the flows at each element listed in the original DBDP and provides a comparison with the 2005 AMENDMENT for the 2-year, 10-year, and 100-year storm runoff events.
