PAVEMENT TEXTURING

Asphalt Surfacing Products Standard Colors

StreetPrint Pavement Texturing replicates the appearance of pavers, brick, cobblestone and other decorative paving products. The texturing process is applied to a substrate consisting of a properly constructed sub-base and a specified hot mix asphalt pavement. The textured surface is then fortified and colored with the StreetBond Surfacing System in one of the colors shown.

StreetPrint Pavement Texturing can only be applied by an Authorized StreetPrint Applicator. For the Applicators in your area, contact:

INTEGRATED PAVING CONCEPTS INC.

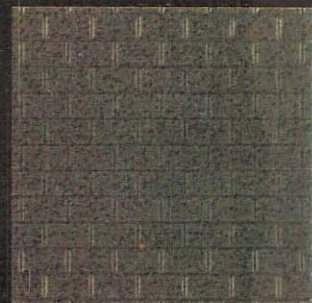

Suite #102, 17957 - 55th Avenue
Surrey, B.C. CANADA V3S 6C4

For more information visit our website at www.streetprint.com.

Note: Using the most modern printing processes, this sample card replicates as nearly as possible the colors of the StreetBond Surfacing System when following approved StreetPrint application procedures. The StreetBond Surfacing System is a cementitious - acrylic system, and as a result, some color variations may occur. Job site conditions, including temperature and humidity during curing, and the use of sealer may also affect the finished appearance. **For more accurate color matching, we suggest the use of color hand samples which may be obtained through the Authorized StreetPrint Applicator in your area.**
